## Storage systems: DAS, NAS and SAN

# DAS, NAS and SAN

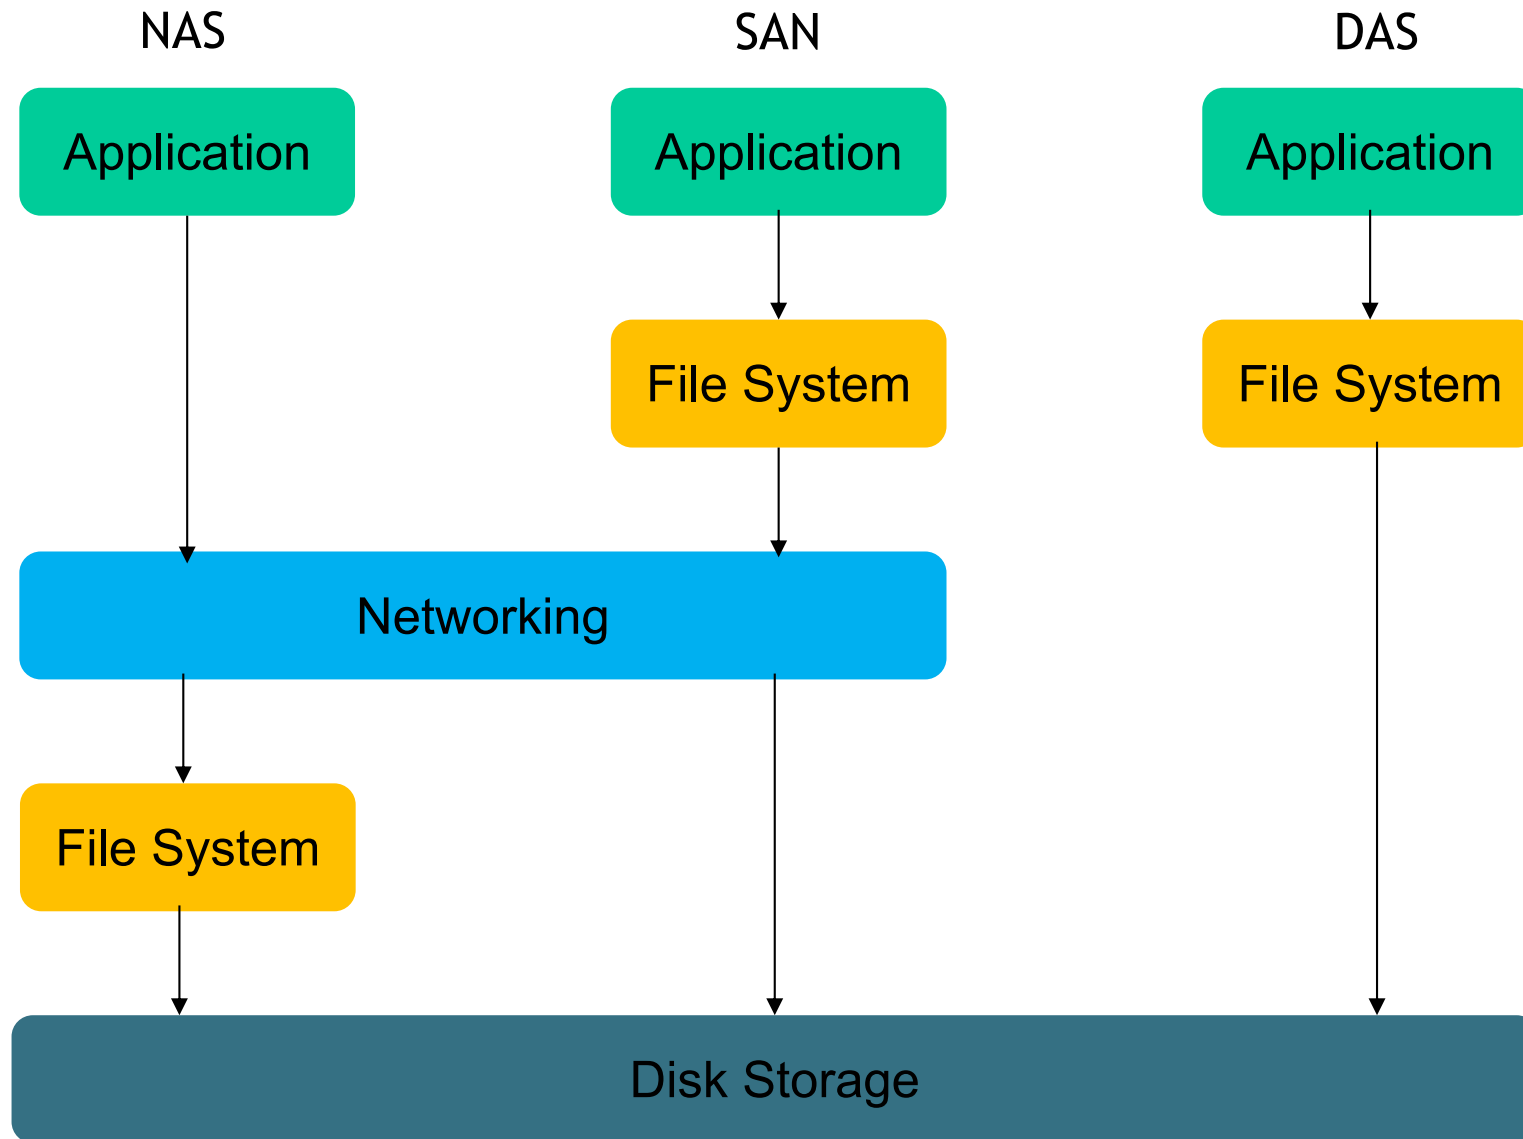

- **DAS - Direct-attached storage**
  - Storage system directly attached to a server or workstation
  - Visible as disks/volumes by the client OS
- **NAS - Network Attached Storage**
  - Storage connected to the network that provides only file-based data storage services (e.g., FTP, Network File System and SAMBA)
  - Visible as File Server to the client OS
- **SAN - Storage Area Networks**
  - Remote storage units
  - Connected to servers using a specific (and dedicated) networking technology
  - Visible as disks/volumes by the client OS
  - Block level storage

# DAS, NAS, SAN: an architectural comparison

## Direct Attached Storage - DAS

- DAS is a storage system directly attached to a server or workstation
- The term is used to differentiate non-networked storage from SAN and NAS (that will be described later)

- **Pros:** Easy setup, performance, Typically no shared network involved
- **Cons:** limited scalability, Not Easy access from other machines (“file sharing” protocol of the OS must be used)
- **Internal and external:** DAS does not necessary mean “internal drives”. All the external disks, connected with a point-to-point protocol to a PC/server can be considered as DAS.

## Network Attached Storage (NAS)

- A NAS unit is a computer connected to a network that provides only file-based data storage services to other devices on the network
  - Each NAS element has its own IP address
- NAS systems contain one or more hard disks (Good scalability), often organized into logical redundant storage containers or RAID
- Provide file-access services to the hosts connected to a TCP/IP network through Networked File Systems/SAMBA

- The key differences between direct-attached storage (DAS) and NAS are
  - DAS is simply an extension of an existing server and is not necessarily networked.
  - NAS is designed as an easy and self-contained solution for sharing files over the network.
- Comparing NAS with local (non-networked) DAS, the performance of NAS depends mainly on the speed of and congestion on the network.

# Storage Area Network - SAN

- **Storage Area Networks**, are remote storage units that are connected to Servers using a specific networking technology.
- SANs have a special network **devoted to** the accesses to storage devices
- **Two distinct networks** (one TCP/IP and one dedicated network, e.g., Fiber Channel)
- **High scalability** (simply increasing the storage devices connected to the SAN network)

- NAS provides both storage and a file system
- This is often contrasted with SAN which provides only block-based storage and leaves file system concerns on the "client" side
- One way to loosely conceptualize **the difference between a NAS and a SAN** is that
  - **NAS appears to the client OS (operating system) as a file server** (the client can map network drives to shares on that server)
  - **a disk available through a SAN still appears to the client OS as a disk**: it will be visible in the disks and volumes management utilities (along with client's local disks), and available to be formatted with a file system
- Traditionally:
  - NAS is used for low-volume access to a large amount of storage by many users
  - SAN is the solution for petabytes ( $10^{12}$ ) of storage and multiple, simultaneous access to files, such as streaming audio/video

## DAS vs. NAS vs. SAN

	Application Domain	Advantages	Disadvantages
DAS	<ul style="list-style-type: none"><li>Budget constraints</li><li>Simple storage solutions</li></ul>	<ul style="list-style-type: none"><li>Easy setup</li><li>Low cost</li><li>High performance</li></ul>	<ul style="list-style-type: none"><li>Limited accessibility</li><li>Limited scalability</li><li>No central management and backup</li></ul>
NAS	<ul style="list-style-type: none"><li>File storage and sharing</li><li>Backups</li></ul>	<ul style="list-style-type: none"><li>Scalability</li><li>Greater accessibility</li><li>Performance</li></ul>	<ul style="list-style-type: none"><li>Increased LAN traffic</li><li>Performance limitations</li><li>Security and reliability</li></ul>
SAN	<ul style="list-style-type: none"><li>DBMS</li><li>Virtualized environments</li></ul>	<ul style="list-style-type: none"><li>Improved performance</li><li>Greater scalability</li><li>Improved availability</li></ul>	<ul style="list-style-type: none"><li>Costs</li><li>Complex setup and maintenance</li></ul>

**!!!Hybrid Storage Architectures are the reality!!!**
